Environmental bioavailability of hydrophobic organochlorines in sediments - A review

Xiujin Qiu, John W. Davis

Dow Chemical Company

ABSTRACT

A number of hydrophobic organochlorines, such as hexachlorobenzene and polychlorinated dibenzo-p-dioxins/dibenzofurans (PCDD/Fs), have been reported to be persistent and bioaccumulative; however, their availability to biota appear to be limited due to strong sorption to soil/sediment and sequestration with age. Studies to date have shown that the bioavailability of hydrophobic organic chemicals (HOCs) in sediments is highly variable, depending not only on a chemical's lipophilicity (K_{ow}), but also molecular steric conformation and sediment characteristics. A subdomain of sediment organic carbon, so-called black carbon (BC), which has much higher affinity to planar HOCs than amorphous organic carbon, has been found to be the predominant repository of many HOCs. The sediment/soil-bound HOCs are composed of a rapid and reversible desorbing labile fraction and a slow-desorbing, or resistant-to-desorbing, nonlabile fraction. The latter can account for up to 98 percent of the total. A number of chemical extraction methods have been under development to measure the actual bioavailable concentrations in soil/sediment and have shown some correlation to the results of bioaccumulation and/or biodegradation tests. To date, most of the published studies on this subject have focused on polynuclear aromatic hydrocarbons (PAHs). This review summarizes the governing processes and the testing methodologies relevant to the environmental bioavailability of hydrophobic organochlorines in soils and sediments. © 2004 Wiley Periodicals, Inc.

SEARCH TIPS

Tip No. 1:

Boolean operators AND, OR, and NOT can be selected from the pulldown selection boxes or entered directly within the search text boxes. You can further restrict searches by selecting a field such as Article Title from the pulldown selection box at the end of the search input box.

Tip No. 2:

Use AND, OR, and NOT to create a more complex search. Use NEAR/ with a number to indicate proximity.

Makale adı, yazar, özetçe, anahtar kelimeler, tüm alanlar gibi seçeneklerden size uygun olanı seçiniz.

VIEW RESULTS

- Results of All Content searches are sorted by product type and can be changed by clicking on the a new selection such as Online Books in the product tab bar.
- Results of Search in this Title searches are limited to one publication and include the product's identifying ISSN or ISBN code in the displayed search string.
- Results of journal Search by Citation searches display a single record for the selected publication.

To view the abstracts for results sequentially:

1. **Select** a few articles.
2. **Scroll** to the end of the results.
3. **Click** "View Selected Items".

Tarama sonuçlarını diskete, bilgisayarınıza ya da kendi profilinize kaydedebilirsiniz.

Keywords: Fatty acid biosynthesis, lipid, biotechnology, acyl transferase,
metabolism.

1 Introduction

This article has been written for this special edition dedicated to oil seed rape. We have tried to summarise current knowledge of lipid biosynthesis in plants, highlight where essential knowledge is missing, and define what research it will be important to undertake in the future. It will be interesting to see how many of these thoughts will come to fruition.

In order to serve these diverse roles a vast complexity of chemical structures of lipids is required. It is not our intention to go into these, as they can be found in a variety of text books and specialised treatise [1], but rather to look at our understanding of the biosynthesis and regulation of fatty acids and triglycerides in plants.

In addition to the roles highlighted above, lipids can form an essential storage reserve in seeds in the form of tri-
